Crash on loading a project

Hello

I am discouraged after one week working on my first project. I used to save it on one project file and everything was ok. I even started to render some great results. But today, I saved it under a different file name to configure it to a different output scheme (720p to HD 1080p).

It crashed down on this second version, I was horrified when seeing that none of the versions can be opened now by kdenlive... !!

I deleted the configure file (.kde/share/config/kdenliverc), but still cant open my project file. Doing the job again from scratch is just heartbreaking me.

Old version console history:

```
hurtut@laptop:~$ kdenlive&
[1] 2446
hurtut@laptop:~$ File given: true
Color mode changed to 0
File given: true
QWidget::insertAction: Attempt to insert null action

```

Does anyone has an idea ?

Bob
