- Kdenlive brainstorming [1]

Hy, i realy like kdenlive and have one idea, to have faster live video.
When i add transiton or effect (rotate + crop + sharpen + color) - in kdenlive i lost live preview - my computer is too slow to render it on real time (i think for any computer we can make task when they cant render on fly.
So why dont add option to settings - render effects to temp folder - then, all effects is rendered on every change. I think is not very problem to add it.
- simple task list to render effects with unique clipId, effect list,

when before render user change somethink task is canceled.

and mayby to options add - how many process melt run (i seee they work in one core so if i have four i can run 2 or 3 task at one time with low priority)

When effect is rendered kdenlive show when we scrool this clip not try live render.

Is possible to add this ?

(i run with ubuntu 12.04 , ati 5400, and 10 GB of ram)
