

Build script failure MLT

Submitted by Kurt Eichenberger on Wed, 05/30/2012 - 03:10

Greetings.

I am a new user of Kdenlive on Fedora 14. As there seems to be some serious problems with the binary from the Fedora 14 repositories, I decided to see if I could build Kdenlive myself.

Environment is 32 bit Fedora 14 on an Intel i7 machine

I followed the directions linked to at the sticky at the top of this page. When I ran the build script, it exited with an error while building MLT (I think) I am no programmer. Here is a clip of the error message:

```
v_mmx.o -L/home/fred/kdenlive/20120529/lib -Wl,--no-undefined -Wl,--as-needed -Wl,--no-undefined
-Wl,--as-needed -L.../framework -lmlt -lpthread -lm -Wl,--no-undefined -Wl,--as-needed `pkg-config
--libs gtk+-2.0` `pkg-config --libs gdk-pixbuf-2.0` -lexif -lm `pkg-config --libs pangoft2`
`pixops_scale_line_22_yuv_mmx' referenced in section `.text' of pixops.o: defined in discarded
section `.note.GNU-stack' of scale_line_22_yuv_mmx.o
collect2: ld returned 1 exit status
make[2]: *** [../libmltgtk2.so] Error 1
make[2]: Leaving directory `/home/fred/kdenlive/src/mlt/src/modules/gtk2'
make[1]: *** [all] Error 1
make[1]: Leaving directory `/home/fred/kdenlive/src/mlt/src/modules'
make: *** [all] Error 1
ERROR: Unable to build mlt
LOG: Process has finished. Reason: FAILURE Some kind of error occured: Unable to build mlt
```

I can include more of this text if it would be helpful. I use Linux exclusively in my architecture practice, and have for many years, but my expertise does not extend to analysing scripts. I can follow simple directions. I was very impressed with Kdenlive, and hope to be able to use it and contribute where I can.

Thank you for any advice with my problem

Kurt Eichenberger
