- Rendering [1]

Hey, i messed up a mayor issue... i used a profile of 720 hd 30 fps when it should be 29,97.... i could render it to a mp4 file and upload it to a youtube, though today i had to project it in stage and neither windows or linux respected the flow of the video... then it was that i understood my mistake. The thing is now i can't export the video... and i would like to have a hint on which would be the smartest way to proceed.
This is the output it gives me exporting to .vob (i think of this format being very versatile... i am so in a hurry that quality doesn't matter that much...)

Rendering of /home/felipe/Videos/limo voces.vob crashed
